EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in an electronic mail message from Jacques Etkowicz on 8/17/10.

The application has been amended as follows.

In the Claims

Please replace claims 1, 20, 28, 30 and 37 with the following claims.

1. A light emitting apparatus comprising:
 - a source of light for emitting light;
 - a down conversion material receiving the emitted light and converting the emitted light into transmitted light and backward transmitted light; and
 - an optic device, having a first end proximal the radiation source and a second end distal the radiation source, the proximal end of the optic device having a width smaller than a width of the distal end, disposed between the source of light and the down conversion material, having at least one transparent side wall absent the down conversion material, configured to receive the backward transmitted light and transfer the backward transmitted light outside of the optic device through the at least one transparent side wall.
20. A light emitting apparatus comprising:

Art Unit: 2875

a light transmissive cylindrical optic comprising at least two separate segments, each of the separate segments having a planar surface adjacent each other;

at least one light radiation source disposed adjacent an end of each of the at least two segments of the cylindrical optic; and

a down conversion material, disposed along a central longitudinal axis within the cylindrical optic, for at least one of transmitting or reflecting light transmitted by the light radiation source, the down conversion material adapted to allow passage of light from one segment into another segment of the cylindrical optic.

28. A light emitting apparatus comprising:

a source of light for emitting light;

a down conversion material receiving the emitted light and converting the emitted light into transmitted light and backward transmitted light; and

an optic device, having a first end proximal the radiation source and a second end distal the radiation source, the proximal end of the optic device having a width smaller than a width of the distal end, disposed between the source of light and the down conversion material, having at least one transparent side wall absent the down conversion material, configured to receive the backward transmitted light and transfer substantially all of the backward transmitted light outside of the optic device through the at least one transparent side wall.

30. A light emitting apparatus comprising:

a source of light for emitting light;

a down conversion material receiving the emitted light and converting the emitted light into transmitted light and backward transmitted light; and

an optic device, having a first end proximal the radiation source and a second end distal the radiation source, the proximal end of the optic device having a width smaller than a width of the distal end, disposed between the source of light and the down conversion material, having at least one transparent side wall, configured to receive the backward transmitted light and transfer the backward transmitted light outside of the optic device between the source of light and the down conversion material through the at least one transparent side wall without passing through the down conversion material.

37. A light emitting apparatus comprising:

a light transmissive cylindrical optic comprising at least two separate segments, each of the separate segments having a planar surface adjacent each other;

at least one light radiation source disposed adjacent an end of the cylindrical optic; and

a down conversion material, disposed along a central longitudinal axis within the cylindrical optic, for at least one of transmitting or reflecting light transmitted by the light radiation source,

wherein a first segment of the at least two separate segments of the cylindrical optic has a first surface, a second segment of the at least two separate segments of the cylindrical optic has a second surface, and the down conversion material is disposed between the first surface and the second surface.

Allowable Subject Matter

The following is an examiner's statement of reasons for allowance. The prior art fails to disclose a light emitting apparatus having the following features:

1) at least one light radiation source disposed adjacent an end of each of the at least two segments of the cylindrical optic; and

a down conversion material, disposed along a central longitudinal axis within the cylindrical optic, for at least one of transmitting or reflecting light transmitted by the light radiation source, the down conversion material adapted to allow passage of light from one segment into another segment of the cylindrical optic as recited in claim 20; and

2) a down conversion material, disposed along a central longitudinal axis within the cylindrical optic, for at least one of transmitting or reflecting light transmitted by the light radiation source,

wherein a first segment of the at least two separate segments of the cylindrical optic has a first surface, a second segment of the at least two separate segments of the cylindrical optic has a second surface, and the down conversion material is disposed between the first surface and the second surface as recited in claim 37.

Regarding claims 1, 28 and 30, various combinations of Arnott, Iwasa and Tarsa (U.S. Patent 7,005,679) disclose the elements, but no motivation exists to combine Arnott or Iwasa with Tarsa.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
